

GAME DEVELOPMENT PROPOSAL

Ultimate Sugar Rush

A cozy merge, cooking, and cafe-renovation game for Android

VISION Merge delightful ingredients, create memorable treats, make customers happy, and build a cafe that feels personally yours.

Concise edition | August 8, 2026

1. Game Overview

Ultimate Sugar Rush is a cozy portrait-oriented Android game that combines merging, cooking, customer service, and cafe renovation. Players merge ingredients into higher-tier items, prepare pastries and drinks at cooking stations, complete customer orders, discover recipes, and use their rewards to restore and personalize a neighborhood bakery-cafe.

Dimension	Direction
Genre	Cozy merge puzzle, cooking, light time management, and decoration
Platform	Android phones; portrait orientation; touch-first controls
Session	Approximately 3-8 minutes per level, with optional cafe time between levels
Audience	Casual and cozy-game players who enjoy food, collecting, story, and customization
Tone	Warm, colorful, welcoming, and satisfying rather than stressful

Core Player Loop

1. Review customer orders or the level objective.
2. Generate, drag, and merge ingredients into higher tiers.
3. Use ovens, mixers, blenders, tea brewers, and topping stations.
4. Serve completed recipes and earn coins, reputation, and renovation rewards.
5. Improve the cafe, unlock content, and continue the neighborhood story.

DESIGN PRINCIPLE Progress must remain visible in both gameplay systems and the cafe itself. The experience should reward creativity and completion without relying on punitive timers or aggressive monetization.

2. Feature Set

Feature Area	Planned Capability
Merge gameplay	Configurable grid, item generators, merge chains, blocked cells, board recovery, boosters, and satisfying animation, sound, and haptics.
Cooking and recipes	Data-driven recipes, station queues, upgrades, discovery, mastery, and a collectible cookbook.
Customers and orders	Preferences, satisfaction, tips, returning regulars, named characters, and special requests.
Levels	Recipe, order, earnings, merge-tier, move, time, satisfaction, and scenario-based objectives.
Cafe progression	Renovation stages, decoration choices, station upgrades, room unlocks, reputation, and persistent customization.
Story and collection	Short character scenes, neighborhood arcs, recipe stories, achievements, memories, and seasonal collections.
Saving and accessibility	Offline-first versioned saves, autosave and recovery, reduced motion, color-independent cues, audio/haptic controls, and alternate placement input.

Recommended Additions

- A garden or windowsill for growing lemons, berries, herbs, and tea.
- A cafe mascot, display case, and customer memory book.
- Friendship levels, weekly recipe challenges, and optional seasonal decor.
- A photo mode for sharing completed cafe layouts.

Initially Deferred

Online accounts, social visits, competitive leaderboards, advertisements, live events, and complex premium economies will remain outside the vertical slice. These systems should be considered only after the core game is proven enjoyable and stable.

3. Tools, Frameworks, and Architecture

Android Studio remains the authoritative Android application and release layer. Godot supplies the full-screen game runtime. The Godot project is packaged as game content and connected to Android through a narrow platform bridge, keeping gameplay independent from optional mobile services.

Tool / Framework	Role	Project Use
Godot 4.7.1	Primary 2D engine	Gameplay, scenes, UI, animation, particles, audio, touch input, and Android runtime.
GDScript	Gameplay language	Fast iteration and direct integration with Godot systems and resources.
Android Studio	Android host and release layer	Lifecycle, manifest, permissions, platform services, signing, APK/AAB builds, and device debugging.
Gradle / Kotlin DSL	Build automation	Dependency management, PCK packaging, Android variants, tests, and release artifacts.
Java	Android host language	Existing application activity and the initial Godot-to-Android platform bridge.
JSON / Godot Resources	Game content	Merge chains, recipes, levels, customers, dialogue, rewards, and renovation definitions.
Git	Version control	Source history, branches, reviews, release tags, and rollback.
Android SDK / ADB	Mobile toolchain	Compilation, installation, device logs, profiling, and API-level testing.
Automated validators	Quality tools	Broken-reference detection, content validation, save migrations, gameplay tests, and build checks.

Build Flow

1. Validate Godot scripts, scenes, and data-defined content.
2. Export the Godot project as a PCK content pack.
3. Package the PCK with the Android Studio host application.
4. Build, sign, test, and distribute APK/AAB variants through Gradle.

4. Milestone Roadmap

Development is organized around working builds and explicit exit deliverables. Scope increases only after the preceding gameplay and technical risks are validated.

ID	Milestone	Status	Exit Deliverable
M0	Foundation	Complete	Godot 4.7.1, Compatibility renderer, portrait project, SDK/export configuration, and Android build verification.
M1	Application shell	In progress	Boot screen, navigation framework, global services, settings, save system, content database, and main cafe screen.
M2	Merge prototype	Next	6x8 board, drag-and-drop, generators, merging, recovery, serialization, feedback, lemonade chain, and cupcake chain.
M3	Cooking and orders	Planned	Oven and blender, recipe completion, customer queue, order fulfillment, level goals, and rewards.
M4	Vertical slice	Planned	5-15 polished levels, six to eight recipes, three customer types, first story arc, renovation choice, and external playtest.
M5	Cafe progression	Planned	Renovations, decoration choices, recipe book, mastery, reputation, recurring customers, and expanded accessibility.
M6	Production	Planned	Launch-volume levels, recipes, characters, story, rooms, artwork, audio, balancing, and performance optimization.
M7	Release	Planned	Closed testing, signed AAB, store assets, privacy documentation, staged rollout, monitoring, and hotfix readiness.

Vertical Slice Target

- A 6x8 merge board with lemonade and cupcake chains.
- An oven and blender with six to eight recipes.
- Three customer types and five to fifteen polished levels.
- Coins, one renovation choice, local saving, settings, and accessibility basics.
- Verified Android APK and AAB build paths.

NEXT IMPLEMENTATION FOCUS Complete the persistent application shell and main cafe screen, then begin the merge-board prototype.
